# Kanban Contribution Evidence

Mohammed Afeefuddin and Muhammad Samad Khan | CODING MASTER

Board: https://sharing.clickup.com/90141780810/b/h/6-901422403415-2/13f8349006cb5fe

Repository: https://github.com/mkhan10004/Movement-Quest-Project-

## Responsibility and traceability

| Member | Established responsibility |
| --- | --- |
| Mohammed Afeefuddin | Lead/UI: navigation, forms, settings, demo coordination, accessibility and integration review. |
| Muhammad Samad Khan | Data and quality: SQLite, CRUD, activity integrity, helper evaluation, tests, documentation and release. |

Afeef owns UI responsibilities; Samad owns data and quality responsibilities. Credit remains attached to the person who actually performed and reviewed the work. The uploaded app images show software behavior, not task ownership or review completion.

## Evidence currently available

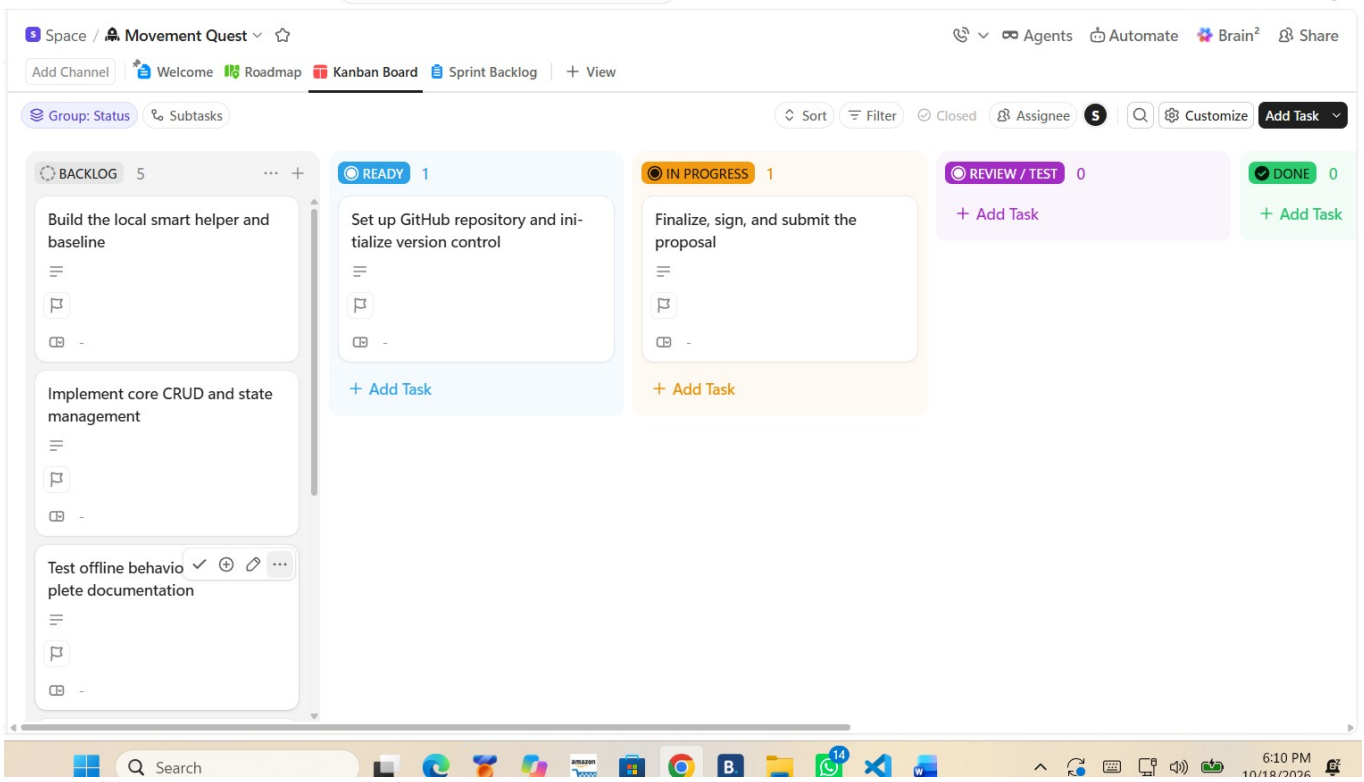

| Checkpoint | Status |
| --- | --- |
| October 18 | Original planning screenshot included on the next page. |
| October 21 | Dated board snapshot not supplied. |
| October 24 | App screenshots supplied; a dated ClickUp board snapshot is still needed. |
| October 28 | Final board snapshot must be captured on the final date. |

## Workflow policy

Backlog, Ready, In progress, Review / test and Done. Limit In progress to one task per member and Review / test to two team tasks. Blocked work counts toward WIP. Done requires actual review/test evidence. This is the course workflow policy, not a claim that historical compliance has been measured.

# October 18 board snapshot

Original image retained without alteration. Visible taskbar reads 6:10 PM on October 18; timezone is not established. Assignees are not readable in this capture.

## October 24 app evidence

Eleven received image files cover ten distinct-looking captures, including the catalog, editor, invalid set input, saved progress and history/delete dialog. These are indexed in evidence/SCREENSHOT_EVIDENCE.md. They cannot substitute for the required board snapshots or individual contribution traces.

## Reported runtime progress

Afeef reports APK operation on two devices. No completed manual matrix, native-device logs or device identities are attached. No synchronization is required because each device stores data locally.

# Contribution evidence still to attach

## Afeef trace

Provide one actual UI/form/navigation/settings task, its owner and acceptance criteria, branch or commit/PR link, relevant function, test result and Samad's review. Preserve the real dates.

## Samad trace

Provide one actual data/helper/testing task with the same links and Afeef's review. Together the traces must cover CRUD, the helper and testing. No commit IDs or completed reviews have been invented.

## Flow reflection

Use actual dated records to report WIP, throughput, work-item age and cycle time. Describe one workflow change and its observed effect. These measurements and a personal reflection from each member have not yet been supplied.

## Final delivery checks

Place the completed PDF in GitHub and each final ZIP. Link the board URL and this exact PDF path from README.md. Check readable screenshots and instructor access. In the recording, each member must trace real work from task through code to test/review.

## Access and completion status

The team previously reported instructor access to the board and repository. This update has not independently verified that access. This PDF remains incomplete until the missing historical evidence is attached or transparently disclosed and the final October 28 evidence is captured.
