Movement Quest Setup and Submission

Start with the code on your computer. Complete the real verification steps before uploading the final package.

First run on Windows

1. Extract the ZIP into a separate folder. Open the folder containing pubspec.yaml in VS Code. Preserve the original repository and any newer local work.
2. Open PowerShell. Add D:\mad\flutter\bin to PATH if necessary. Run flutter doctor and start an Android emulator/device.
3. Run: powershell -ExecutionPolicy Bypass -File scripts\prepare_android.ps1
4. Run: powershell -ExecutionPolicy Bypass -File scripts\verify.ps1
5. Run flutter devices, then flutter run -d followed by your real device ID.

What the setup scripts do

prepare_android generates the standard native runner from your installed Flutter SDK without overwriting an existing android folder. verify resolves dependencies, formats code, runs analysis/tests and saves output. build_release runs verification and copies the built APK into submission/. Package resolution and Android build are still pending in this handoff.

Original ownership

Afeef: UI, forms, navigation, settings, demo and accessibility/integration review. Samad: SQLite/data integrity, activity persistence, helper evaluation, tests, documentation and release. Keep real contributions/commits/reviews under the person who performed them.

First functional demonstration

Create a 2-set x 10-target-rep plan. Start, log 10 then 8, edit the first set to 9 and finish. History should show [9,8]. Test add/edit/delete of a past session. Keep a new partial draft, close the app offline and verify it resumes. Then follow every manual check on two Android configurations.

What goes where

Destination	Contents
GitHub repository	Source, tests, Android runner, package lockfile, README, architecture, helper evaluation, docs/design and completed Kanban_Contribution_Evidence.pdf.
iCollege before recording	CODING_MASTER_Project1_SelectedQuestions.docx: the ten selected questions with full text and no answers.
YouTube	Actual 20-25 minute team demo with app and VS Code walkthrough, selected Q&A, both members and task/code/test evidence. Verify instructor access.
Each member's final iCollege ZIP	Required documents, approved proposal, official signed acknowledgment, completed evidence PDF, tested APK and real repository/video links.

Still required from real work

Build/install/test the APK. Complete missing screenshots and contribution traces, peer feedback/revision and personal reflections. Add the actual signed acknowledgment and approval evidence. Record the video and replace its placeholder link. Use the instructor-assigned group number in the final ZIP name.

Dates

October 24 is the functional/evidence planning checkpoint. Final submission is October 28, 2026 at 11:59 PM Eastern according to the supplied guide. Selected questions go to iCollege before the presentation is recorded. Check the instructor's latest announcements for any change.

Verification already performed

Dart helper: 10/10 expected-output checks, with 6/7 synthetic preference matches versus baseline 4/7. Host SQLite schema: 9/9 checks. Flutter tests, Android build and actual device behavior are not yet verified. This package must not be submitted unchanged as a complete final project.
